

[illegible]

1. A pointing device for moving a pointer shown on a display screen, comprising:
 - a transparent plate having an outer surface to contact a surface of an object;
 - image detecting means for detecting an image of the surface of said object that contacts an outer surface of said plate; and
 - optical means for forming an image on the outer surface of said plate on a detection plane of said image detecting means,wherein said pointer is configured to be able to move according to a movement of the image on the outer surface of said plate detected by said image detecting means.
2. A portable information terminal provided with a pointing device according to claim 1, comprising means for detecting a movement of said image detected by said image detecting means and moving said pointer in a direction according to the direction of said detected movement.
3. A portable information terminal provided with a pointing device according to claim 1, comprising means for determining a presence/absence of movement of the image on the outer surface of said plate detected by said image detecting means and switching a sensing frequency of said image detecting means according to the determination result.

5. A portable information terminal provided with a pointing device according to claim 4, further comprising:

second means for designating a quantity of light emitted of said light emitting means as a first reference value when the reflection factor measured by said first means falls below a predetermined minimum reference value and adjusting the quantity of light emitted of said light emitting means when the reflection factor measured by said first means exceeds said minimum reference value so that the quantity of light received by said image detecting means becomes a predetermined second reference value which is larger than said first reference value;

fourth means for determining a presence/absence of movement of said image detected by said image detecting means, setting said pointing

9. The portable information terminal provided with a pointing device according to claim 8,

said image detecting means is an image pick-up element, and there are provided:

means for switching between said first and second condensing lenses and inserting between said plate and said image pick-up element, and

10. The portable information terminal provided with a pointing device according to claim 8, wherein optical means of said pointing device is a condensing lens capable of switching between a first focal distance at which the image on the outer surface of said plate is formed on the detection plane of said

~~said image detecting means is an image pickup element and is configured to be able to pick up the image of an object by said image pick-up element at a longer distance than the outer surface of said plate by setting the focal distance of said condensing lens to said second focal distance.~~
